Data Example

# About This Lesson

# Data Example: Smoking

- Between 1972 and 1974, a survey was taken in Whickham, a mixed urban and rural district near Newcastle upon Tyne, United Kingdom.
  - Among the information obtained originally was whether a person was a smoker or not.
- Twenty years later a follow-up study was conducted.
  - 76.12% of the 582 smokers were still alive, while only 68.58% of 732 nonsmokers were still alive.

Smokers had a higher survival rate than nonsmokers!  
Call Philip Morris, smoking leads to a longer life span!

*Acknowledgement: This example was provided by Dr. Jeffrey Simonoff from New York University.*

# Data Example in R

## ## Read data in R

```
smoking <- read.table("CIGARETT.dat", sep=" ", row.names=NULL)
names(smoking) <- c("Age", "Smoker", "Survived", "At.risk")
attach(smoking)
```

## ## Plot proportion of survival

```
plot(Age, Survived/At.risk, xlab="Age", ylab="Survival Proportion", col=c("red", "blue"), lwd=3)
legend(30, 0.2, legend=c("Smokers", "Non-smokers"), pch=1, col=c("red", "blue"))
```

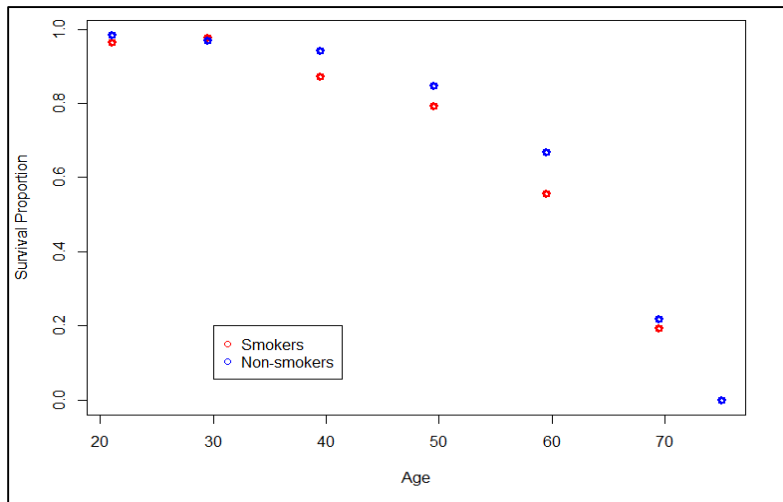

# Data Example in R

## ## Read data in R

```
smoking <- read.table("CIGARETT.dat", sep=" ", row.names=NULL)
names(smoking) <- c("Age", "Smoker", "Survived", "At.risk")
attach(smoking)
```

## ## Plot proportion of survival

```
plot(Age, Survived/At.risk, xlab="Age", ylab="Survival Proportion", col=c("red", "blue"), lwd=3)
legend(30, 0.2, legend=c("Smokers", "Non-smokers"), pch=1, col=c("red", "blue"))
```

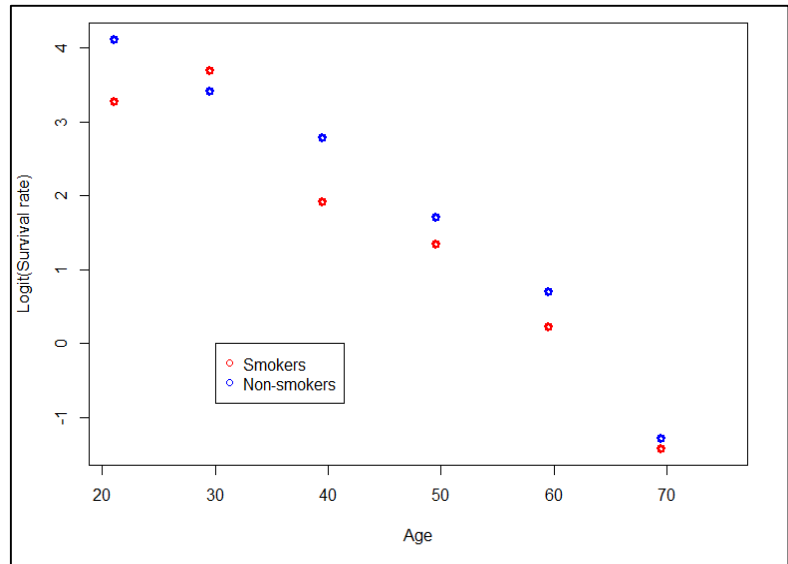

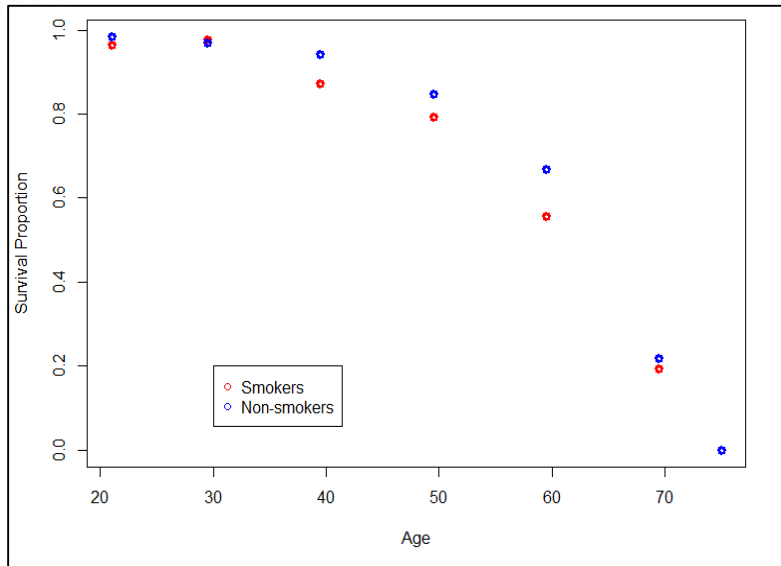

# Data Example in R (cont'd)

**## Plot of logit transformation of the proportion survival**

```
prop.survival <- Survived/At.risk
```

```
plot(Age, log(prop.survival/(1-prop.survival)), col=c("red", "blue"), xlab="Age", ylab="Logit(Survival Proportion)", lwd=3)
```

```
legend(30, 0, legend=c("Smokers", "Non-smokers"), pch=1, col=c("red", "blue"))
```

# Summary
